

Australian Standard[®]

Automotive repairs—Terminology

Part 6: Constant velocity joints

This Australian Standard was prepared by Committee CS/78, Automotive Repairs Terminology. It was approved on behalf of the Council of Standards Australia on 15 November 1993 and published on 14 March 1994.

The following interests are represented on Committee CS/78:

Australian Automotive Association
Australian Automotive Aftermarket Association
Australian Federation of Consumer Organizations
Australian Transmission Rebuilders Association
Business and Consumer Affairs, N.S.W.
Institute of Automotive Mechanical Engineers
Motor Trades Association of Australia
Motor Vehicle Repair Industry Council
Society of Automotive Engineers, Australia
Victorian Automobile Chamber of Commerce

Review of Australian Standards. To keep abreast of progress in industry, Australian Standards are subject to periodic review and are kept up to date by the issue of amendments or new editions as necessary. It is important therefore that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.

Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.

Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.

This Standard was issued in draft form for comment as DR 92235.

Australian Standard®

Automotive repairs—Terminology

Part 6: Constant velocity joints

First published as AS 3564.6— 1994.

PREFACE

This Standard was prepared by the Standards Australia Committee on Automotive Repairs Terminology. It is one of a series arising out of submissions by the automotive repairs industry, and consumer and government organizations.

The Standard aims at eliminating confusion in relation to terminology used to describe repairs to automotive constant velocity joints.

Other Standards in this series are as follows:

- AS
- 3564 *Automotive repairs—Terminology*
- 3564.1 Part 1: *Automatic transmission*
- 3564.2 Part 2: *Manual transmission*
- 3564.3 Part 3: *Transaxle*
- 3564.4 Part 4: *Power steering*
- 3564.5 Part 5: *Engine*

The term ‘normative’ has been used in this Standard to define the application of the appendix to which it applies. A ‘normative’ appendix is an integral part of a Standard.

Users of Standards are reminded that copyright subsists in all Standards Australia publications and software. Except where the Copyright Act allows and except where provided for below no publications or software produced by Standards Australia may be reproduced, stored in a retrieval system in any form or transmitted by any means without prior permission in writing from Standards Australia. Permission may be conditional on an appropriate royalty payment. Requests for permission and information on commercial software royalties should be directed to the head office of Standards Australia.

Standards Australia will permit up to 10 percent of the technical content pages of a Standard to be copied for use exclusively in-house by purchasers of the Standard without payment of a royalty or advice to Standards Australia.

Standards Australia will also permit the inclusion of its copyright material in computer software programs for no royalty payment provided such programs are used exclusively in-house by the creators of the programs.

Care should be taken to ensure that material used is from the current edition of the Standard and that it is updated whenever the Standard is amended or revised. The number and date of the Standard should therefore be clearly identified.

The use of material in print form or in computer software programs to be used commercially, with or without payment, or in commercial contracts is subject to the payment of a royalty. This policy may be varied by Standards Australia at any time.

STANDARDS AUSTRALIA

Australian Standard

Automotive repairs—Terminology

Part 6: Constant velocity joints

1 SCOPE This Standard sets out a terminology for use in describing the repair and servicing of constant velocity (cv) joints and constant velocity shaft assemblies.

2 REFERENCED DOCUMENTS The following documents are referred to in this Standard:

IP

220 Rust Prevention Characteristics of Lubricating Greases (ST-D-3)

ASTM

D217 Test Method for Cone Penetration of Lubricating Grease

D445 Test Method for Kinematic Viscosity of Transparent and Opaque Liquids (and the Calculation of Dynamic Viscosity)

D942 Test Method for Oxidation Stability of Lubricating Greases by the Oxygen Bomb Method

D1742 Test Method for Oil Separation from Lubricating Grease During Storage

D1831 Test Method for Roll Stability of Lubricating Grease

D2265 Test Method for Dropping Point of Lubricating Grease Over Wide Temperature Range

D2266 Test Method for Wear Preventive Characteristics of Lubricating Grease (Four Ball Method)

D2509 Method for Measurement of Extreme Pressure Properties of Lubricating Grease (Timken Method)

D2596 Method for Measurement of Extreme Pressure Properties of Lubricating Greases (Four-ball Method)

3 DEFINITIONS For the purpose of this Standard, the definitions below apply.

3.1 Boot—a cover to protect working components against dust, dirt, grit or similar eroding substances and to act as a container for retaining grease around its component. Boots are generally made from rubber, plastic or similar materials.

3.2 Constant velocity joint—a device for the transmission of driving power. These CV joints consist of five different types as set out below:

3.2.1 Disc cross groove CV joint (VL joint)—a disc cross groove CV joint operating on the same principle as a double offset joint (DOJ) but with a flatter design and used in applications where space is minimal. It is usually attached by six bolts to a drive flange (see Figure A5).

3.2.2 Double offset joint (DOJ), inner or end-motion type (inner) CV joint—a radially self-supported CV joint which consists of an outer and inner race driven through six balls, located in axially straight grooves. The balls are positioned and maintained in a constant velocity plane by a cage with axially offset spherical surfaces located between the two races. The joint permits axial movement since the cage is engaged only by the inner race (see Figures A4(a) and A4(b)).
